Data are calculated, estimated, or reported. See notes for more information.

## Lithium Worksheet Notes

## Data Sources

The sources of data for the lithium worksheet are the mineral statistics publications of the U.S. Bureau of Mines and the U.S. Geological Survey-Minerals Yearbook (MYB) and its predecessor, Mineral Resources of the United States (MR); Mineral Commodity Summaries (MCS) and its predecessor, Commodity Data Summaries (CDS); and U.S. Bureau of Mines Circular 8053 (Schreck, 1961). The years of publication and corresponding years of data coverage are listed in the References section below. Blank cells in the worksheet indicate that data were either not available or were withheld to avoid disclosing proprietary information.

## Production

Production data for lithium refers to lithium contained in material produced or shipped from mines and brine operations in the United States. Production data for the years 1940-54 include both gross tons of lithium minerals and compound production and $\mathrm{Li}_{2} \mathrm{O}$ content of these products. $\mathrm{Li}_{2} \mathrm{O}$ contains 46.46 percent lithium; this information was used to determine lithium content for those years. Because production data for the years 1940-54 included dilithium sodium phosphate, the average lithium content of domestic production varied from 2.50 percent to 5.20 percent for the period. Most lithium ores average about 2.00 percent and, and dilithium sodium phosphate contains about 10.5 percent lithium.

Prior to 1940, the quantities of different lithium-bearing materials were not specified so that assumptions were made to estimate lithium content. Dilithium sodium phosphate was produced during the years 1938-78, so adjustments were made for the years 1938 and 1939. Lithium content was estimated as 2.50 percent for 1939 and 2.00 percent for 1938. Production data from 1900 through 1954 were taken from U.S. Bureau of Mines Information Circular 8053 (Schreck, 1961). For the years 1929, 1931, 1932, and 1955 to the most recent, production data were withheld to avoid disclosure of individual company confidential data.

## Imports

Import data for the years 1960-70 are from the MCS, while import data for the years 1971 to the most recent are from the Salient Statistics table in the MYB. All import data are in contained lithium. Most imports for the years 1960-88 were mineral concentrates used in ceramics and glass not used to produce lithium compounds. In addition, during this period, the compounds reported as imports varied from year to year. Often the designations were nonspecific, such as compounds, salts, and/or organic salts making the reported lithium contents questionable. When the U.S. Census Bureau (USCB) began using the Harmonized Tariff Schedule in 1989, lithium carbonate and lithium hydroxide imports were specified. Unfortunately, other categories of lithium compounds were combined in nonspecific categories. Since 1989, imports of lithium ores and ore concentrates have not been reported by USCB, although the United States remains a major importer of these materials. Lithium metal imports became unavailable also. For these reasons, a large percentage of lithium imports go unreported. Import data are not available for the years 1900-59.

## Exports

All export data are in contained lithium. For the years 1971-81, USCB reported exports of lithium hydroxide only. Data for other compounds were estimated with reported imports by other countries of U.S. lithium compounds. However, the lithium hydroxide data were significantly lower than the reported lithium hydroxide imports of the other countries listed. For the years 1982-88, USCB reported exports of lithium carbonate, lithium hydroxide, and other lithium compounds. Data are from the Salient Statistics table in the MYB. Export data are not available for the years 1900-70.

## Apparent Consumption

Consumption data are in contained lithium. Production data were used to estimate consumption from 1900-54, since import and export data were not available. Apparent consumption data for the years 1929, 1931, and 1932 were interpolated since data for these years were not available. From 1955-70, consumption was interpolated. Consumption data for the years 1971 to the most recent were taken from the Salient Statistics table in the MYB where the data are reported as estimated consumption.

## Unit Value (\$/t)

Unit value is the value of 1 metric ton ( t ) of lithium apparent consumption. The price series for lithium carbonate was used to estimate unit value for lithium. Lithium carbonate is a good estimator of unit value due to the large quantity and importance of this compound compared to other lithium compounds. Data prior to 2001 is a continuation of the published price series ( $\$ / k i l o g r a m$ ) converted to $\$ / t$, for lithium carbonate provided by the Lithium Commodity Specialist. Since 2001, unit value has been based on the average USCB import price data available in the "Prices" section of the MYB.

## Unit Value (98\$/t)

The Consumer Price Index conversion factor, with 1998 as the base year, was used to adjust the unit value in current U.S. dollars to unit value in constant 1998 U.S. dollars.

## World Production

World production data are in metric tons of gross product of lithium minerals and brine. Since 1967, lithium production was reported as ore and ore concentrates from mines and lithium carbonate from brine deposits. World production data for the years 1966-67 do not
include data from Rhodesia (Zimbabwe) and some other African countries. Zimbabwe was by far the largest producer at the time. After 1954, world production does not include U.S. production. Data were not available for the years 1900-24.
